Madrid, relocating to Berlin in October 2026, available full-time · EU citizen, no work permit needed · French and Spanish native, English C1, German A1 (learning)

PROFILE

Automation analyst in Cabify's Operational Excellence team in Spain, with an industrial engineering background. I turn manual operations work into systems that run on their own: AI agents and n8n automations with Claude and local models, internal web apps and data pipelines in Python and SQL, and computer vision and forecasting models I train myself. 39 n8n workflows in production, plus Python services on the team's Mac mini. Case studies with architecture and screenshots at mathieutellene.github.io.

EXPERIENCE

Cabify · OEx Automation Analyst

May 2026 to present

Madrid, hybrid. Two promotions in six months: Customer Operations Trainee (Nov 2025), Operational Excellence Analyst (Mar 2026).

- **AQM · Asset Quality Management.** Capture forms with photo checks and live plate OCR, a 74-node n8n pipeline where a Claude vision model compares each photo with its reference design, one fleet database and a live dashboard. +25,000 photos audited at 97% accuracy against human review, 30 to 60 minutes from photo to verdict. Handed to Product as the basis for a native version.
- **DQM · Driver Quality Management.** Delivery lead for a 0 to 100 score per driver, compared only within its region, fleet type and lifecycle-stage cohort, with a 28-day memory and a graded escalation ladder. Python and PostgreSQL engine and an 18-screen simulator; part of the Spain block of the company All Hands.
- **COPs Control.** Python and PostgreSQL pipeline on the team's Mac mini that reads 691 KPIs from 46 processes straight from Redshift every morning, standardised by category, judges each against a rolling-median range and scores its own forecast. A local model (Ollama) prepares each deviation for the weekly review; accepted deep dives become ClickUp tasks (103 automated tests).
- **ADP and RPA Uploader.** Portal where every change to a vehicle's commercial products becomes a rule with an author, a reason and an expiry (60 rules, 33 products, 104 checks), and an RPA Uploader (first Python and Playwright, now n8n on internal admin APIs) that recognises 33 RPA products by their columns, splits large files into parallel parts (60 to 13 minutes) and reports the real result in Slack. About 28 hours a month of manual work removed.
- **AI agents.** WhatsApp ride-booking agent (first fully automated ride in May 2026; rebuilt in October as 15 n8n workflows, 44 Madrid hubs, two languages, rollout at scale approved); email-to-reservation pipeline for two B2B clients: Claude agents read their emails and rides are created, changed and cancelled on their own through the public ride API, plus a web hub with sign-in for a dedicated fleet; CabiBot, the Help Center agent: +13,000 conversations, 86% resolved without a person in its first week.
- **Hybrid vision and LLM cost.** Neural networks I trained on 16,000+ labelled photos (a Keras CNN from scratch, then a ResNet18 cascade) take the repetitive checks from the LLM: about 80% lower inference cost. Traced 96% of the team's LLM spend to one unfiltered agent tool; the fix made each run 63× cheaper, and prompt caching cut cost per request by 40%.
- **Forecasting and staffing.** 2,160 Prophet models trained per series, the best kept on a 28-day holdout: 58% lower error than the official support volume forecast; model-based quarterly targets for about 140 KPIs; weekly staffing matrix for the outsourced contact centre (Erlang C and OR-Tools CP-SAT, up to 400 agents).
- **Booking price benchmark.** Cabify vs main competitor next-day booking prices: 16 routes in Madrid and Barcelona, 4 pickup times, 128 checks a day, compared by equivalent product.
- n8n trainer at the company academy: co-taught the Level 2 workshop (30 September 2026) on two of my production workflows.

Collins Aerospace · Production and Logistics Engineering Intern

Jul 2025 to Sep 2025

Getafe, Madrid

- Traced over-ordering on a manufacturing cell to ERP discrepancies and recalculated minimum, maximum and reorder points: about 35% lower inventory cost on that cell. Value stream mapping led to a new task sequence and about 15% more output. The site later offered me a full-time position.

EDUCATION

B.Eng. Industrial Organization Engineering
Universidad Rey Juan Carlos, Madrid · 2021 to 2027, thesis pending (expected May 2027) · GPA 7.71/10 with honours

First year of software engineering, Universidad Politécnica de Madrid (2020 to 2021). French baccalaureate, Lycée français de Madrid.

COURSES AND CERTIFICATES

- **Agentic AI** · DeepLearning.AI — in progress
- **AI Agents Course** · Hugging Face — next
- **Machine Learning Specialization** · DeepLearning.AI and Stanford Online — 2026
- **Business for All** · Harvard Business School — 2024

SKILLS

Automation and AI: n8n, Claude API (tool use, prompt caching), multi-agent pipelines, MCP, Claude Code, LiteLLM, Ollama, Playwright

Data: Python (pandas), SQL and PostgreSQL, Redshift, Tableau and its REST API, Google Apps Script, Looker Studio, Grafana

Modelling: PyTorch, Keras, YOLOv8, EasyOCR, Prophet, LightGBM, SARIMAX, OR-Tools CP-SAT, Erlang C

Operations: process mapping, value stream mapping, KPI design, workforce planning, Git and GitLab CI
